

ShiftSnap

Streamlining Shift Scheduling for Nurses and Call
Center Agents

Project proposal by Yalung, Hans Jeremy C.
CS-302 · 6ADET
October 9, 2026

The gap between paper and time

Rotating schedules still live on printed duty rosters. Workers photograph them, then manually copy every shift into a phone calendar — a tedious, error-prone ritual.

A photo that is never checked can become a shift that is missed.

Built for schedules that refuse to sit still

NURSES

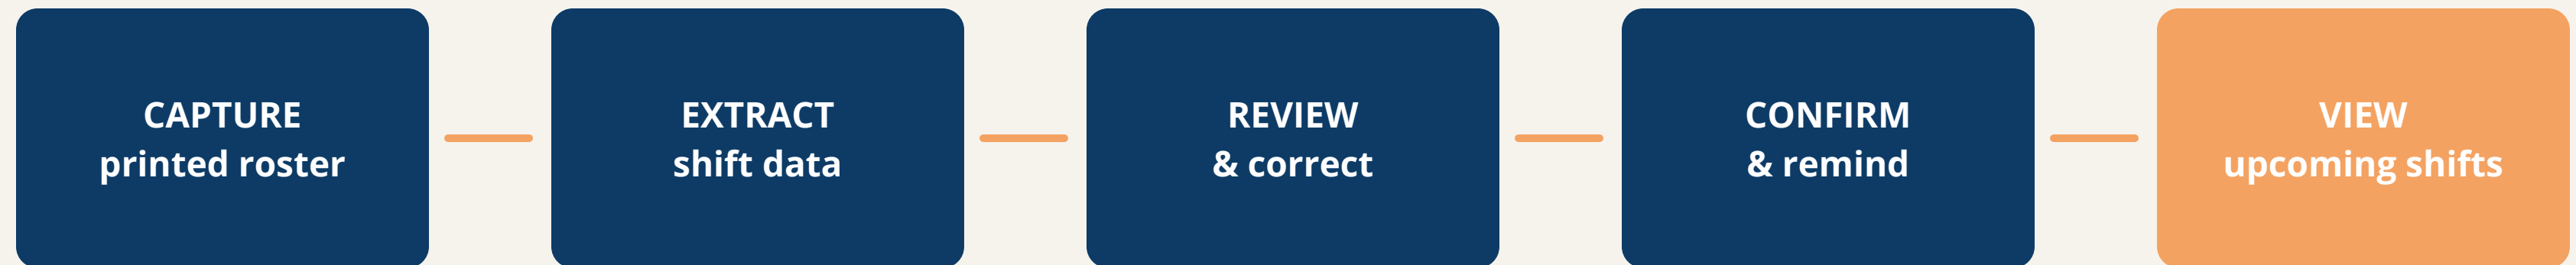

Weekly rotations · physical noticeboards

CALL CENTER AGENTS

Frequent changes · repeated photo checks

From roster to reminder in one confident flow

ShiftSnap turns an unstructured photo into a confirmed, reminder-ready schedule.

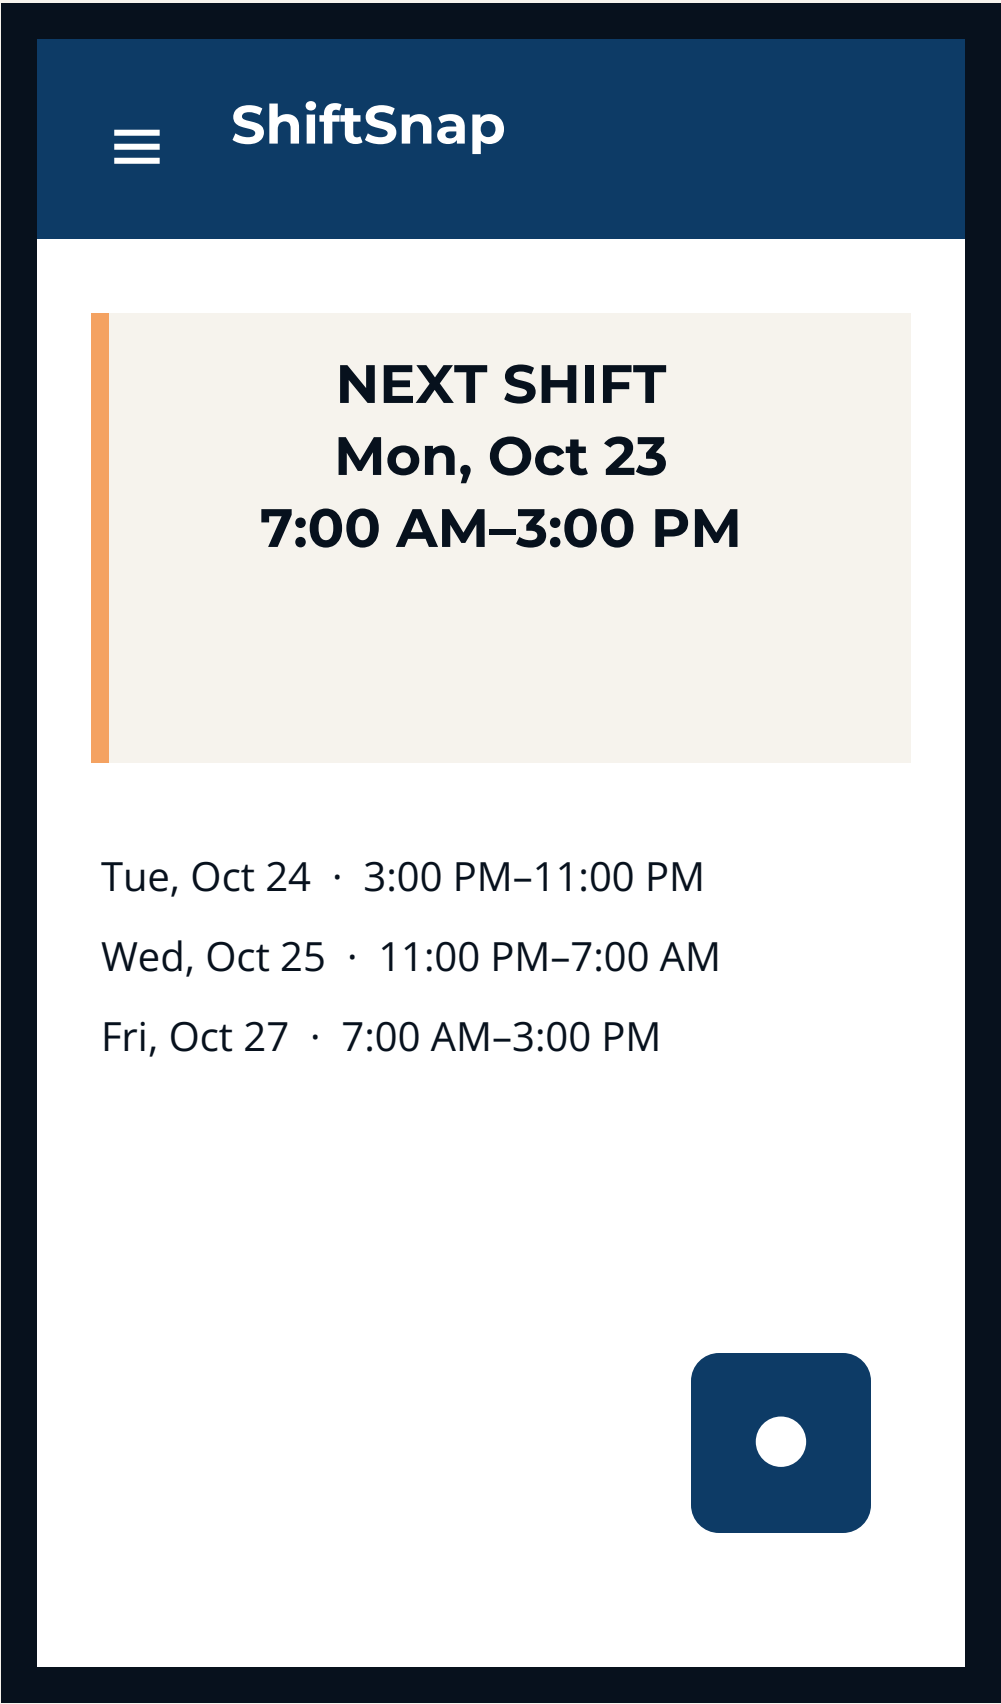

Gemini API extraction

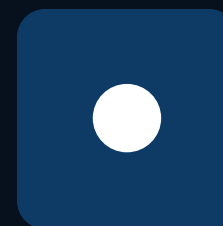

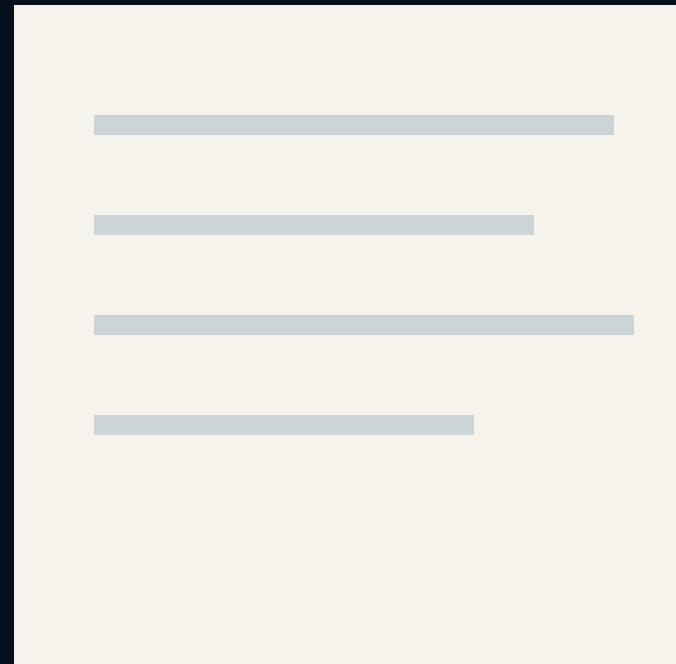

Accuracy where automation helps. Control where people need it.

Home, at a glance

The next shift gets priority. Upcoming confirmed shifts follow chronologically, while the floating camera action keeps roster capture one tap away.

Ensure photo is clear

Capture only what matters

A quiet viewfinder, one instruction, one decisive action. The interface removes distraction so extraction starts with the clearest possible image.

Review before it becomes real

Editable cards keep title, date and time visible. Users can correct or delete individual shifts, then confirm the set with one clear action.

Review shifts

USER PREFERENCES

reminderMinutesBefore
local notifications

Ship the essential loop. Then widen the orbit.

MVP

- 01 Capture + Gemini extraction
- 02 Review + confirm shifts
- 03 Set reminder preferences
- 04 View upcoming shifts

STRETCH

- Manual entry fallback
- External calendar sync
- Next-shift home widget

The risk is imperfect extraction. The value is confident action.

RISK

Roster handwriting and formats vary, so Gemini API accuracy will vary too.

MITIGATE

Refine the prompt. Test real rosters early. Keep manual entry as the fallback.

Convenience. Accuracy. Empowerment.
Never miss a shift again.
