

The problem in one sentence:

Nurses and call center agents with rotating schedules take a photo of the printed duty roster, which they manually copy into phone calendars—a tedious process resulting in errors and forgetting to check the photo leading to missed shifts.

Who is this for:

Workers whose weekly schedule is posted on a physical noticeboard. They currently take a photo of the roster on their phone, then either manually copy each shift into their phone calendar (which they often skip because it's annoying) or rely on checking the photo—meaning they sometimes forget shifts, especially when shifts change week to week.

Core features (MVP)

- **Capture and scan roster:** User taps the floating camera button and takes a photo of the printed duty schedule. The photo is sent to the Gemini API, which extracts shift details (Shift Title, Dates, Times) automatically.
- **Review and confirm extracted shifts:** Shows the extracted shifts as a list of editable cards. Each card displays the Shift Title (e.g., Morning Shift), Date, and Time. Users can tap edit to open a quick modal popup to fix details or add descriptions, or tap delete to discard a shift.
- **Set reminder preference (via Hamburger Menu):** Users set how many minutes before each shift they want to be reminded. The app saves this preference and schedules a local notification for each confirmed shift.
- **View upcoming shifts:** Opening the app's Home screen displays the "Next Shift" highlighted in a hero card at the top, followed by a chronological list of upcoming confirmed shifts.

Stretch goals

- Let the user add a roster manually if Gemini can't detect it.
- Sync confirmed shifts to a calendar as well.
- Widget showing the next shift on the home screen.

Data the app needs to remember

- **Thing 1:** Scanned Roster – image ID / image path (in local storage), Date Scanned, Total Duration (optional: how many days/weeks this roster covers).
- **Thing 2:** Shift – Shift Title (e.g., Morning/Night), Date, Start Time, End Time, Description (optional), confirmed (bool).
- **Thing 3:** User Preferences – reminderMinutesBefore (integer, e.g., 60).

Screens you'll need

- **Home Screen:** Deep Navy app bar with a hamburger menu. Displays the "Next Shift" hero card and standard "Upcoming Shift" cards. Includes a floating camera button.
- **Camera Capture Screen:** Camera viewfinder with an "Ensure photo is clear" overlay instruction and a shutter button.

- **Review Shifts Screen:** List of extracted shifts with Amber accent borders. Each card has edit/delete actions. Includes a "Home" navigation pill and a primary "Confirm & Save" button.
- **Edit Pop Up (Modal):** Replaces the dedicated edit screen. A modal window overlay for quick edits to Title, Date, Time, and Description.

The Risk The Gemini API's accuracy in extracting structured shift data from varied roster formats (different handwriting, table layouts, abbreviations). I'll need to write a carefully engineered prompt and test with 3 - 5 different real roster formats early. If extraction is inconsistent, I'll fallback to an "Add Shift" manual option.
